Description: The main quality of this game is that it stores all the data in the file "mem.dec".

This means that you can set the game-station to send the data through internet to a specific email address and have access to all the information of monitored game-station. The

game is tested for years in hall games and does not have any major bugs. It's "math" is attractive and it has a good percent. Once the game-station is setup the game will break only when physical components will break.

The game does not require strong pc. Cheap but stable units will do. The costs for building a cabinet for this game are low..

Very stable on a WinXp platform with no modifications from initial setup(Tiny, Micro...)

-Can work with 2 different controllers, it's own controller and with classical "green controller"

-It's controller is simple to build, and it has no components that have software written on.

-The controller it's cheap to build and it controls everything (buttons, lamps, bill acceptor, key

in/out e.t.c.)

-The game works with a wide variety of bill acceptors that can be connected through serial Com port for fast adding credits.

-The game can be controlled completely from keyboard so you can make yourself the third controller from a common keyboard (you will not have lamps!).

Supports 2 monitors

The games resources are editable

-It has no encryption so you can make minor adjustments even in exe or dll
